New nucleic acid encoding gamma subunits of human G protein - used to detect mutation(s) in, or altered levels of, the subunits and to screen for agonists and antagonists of G protein interaction Claim 1; Page 29; 40pp; Enclish.

Claim 1; Page 29; 40pp; Enclish.

CDNA clones (T47669-75) respectively code for human G protein agamma-2, gamma-3, gamma-4, gamma-5, gamma-7, gamma-11 and gamma-11 subunits (W09412-18). Several human CDNA libraries were partially sequenced to identify expressed sequence tags (EST). By matching sequences of EST to genes of known structure, the 7 new subunit sequences were laolated. The cDNA clone for gamma-11 has been deposited as ATCC 97139. The isolated cDNA clones can be used to produce recombinant gamma subunits in prokaryotic or eukaryotic and the constant of the propertic and diagnostic and account of the constant of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    agents. The nucleic acids can also be used to produce probes to detect mutations in human G protein subunit sequences and for chromosome identification.
19-WAY-1997 (first entry)
Human G protein gamma-11 subunit cDNA.
G protein; signal transduction; agonist; antagonist; diagnosis;

```
CC (W01604) and TSB281 and TSB282) respectively code for the STZ (W01604) and STO (W01605) polypeptides of Arabidopsis thaliana. CC They were isolated by using clones of an A. thaliana cDNA library CC to transform yeast strains that lacked active calcineurin proteins (i.e. they were more sensitive to growth inhibition by CC salt than wild-type strains). Clones that complemented the salt cC salt the ability to confer salt tolerance analysis. STZ and CT have the ability to confer salt tolerance to plants, yeast, CC fungi and other organisms. Recombinant expression cassettes incorporating the STZ or STO sequence can be used to produce CC transgenic plants able to grow under saline conditions.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Mean 8.940; Variance 5.499; scale 1.626

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 12.169; Variance 6.306; scale 1.930

```
/note="vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not: Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots: 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA cliserts were directionally cloned with Sal-Not arms using //db_xref="taxon:3702"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DEFINITION 16899 Lambda-PRL2 Arabidopsis thaliana cDNA clone 189D15T7, mRNA sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note="vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light eyrole, half on 16 hr light, 8 hour dark rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA cliserts were directionally cloned with Sal-Not arms using /db_xref="taxon:3702"
                                                                                                                                                                                                                   Newman, T., deBruin, F.J., Green, P., Keegstra, K., Kende, H., McIntosh, L., Ohirogge, J., Raikhel, N., Somerville, S., Thomashow, M., Retzel, E. and Somerville, G. and Ingerscale gartial sequencing of anonymous Arabidopsis cDNA clones ps148729

Lambda PRL2 is a cDNA library derived from equal

quantities of 4 pools of mRNA. The mRNA sources were 1) 7

quantities of 4 pools of mRNA. The mRNA sources were 1) 7

quy germinated etiolated seedlings: 2) tissue culture

grown roots; 3) staged plants half with 24 hour light

cycle, half on 16 hr light, 8 hour dark-rosettes: 4)

same plants as 3 but aerial tissue (stems, flowers and

sliques. The vector is BRL's lambda Zip-Lox. The cDNA

inserts were directionally cloned with Sal-Not arms using

oligo dr primed cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AU002699 620 bp mRNA EST 15-JAN-1999

Lambda PRL2 is a cDNA library derived from equal
quantities of 4 pools of mRNA. The mRNA sources were 1)
day germinated etiolated seedlings: 2) tissue culture
grown roots; 3) staged plants half with 24 hour light
cycle, half on 16 hr light, 8 hour dark-rosettes; 4)
same plants as 3 but aerial tissue (stems, flowers and
siliques. The vector is BL's lambda Zip-Lox. The obnA
inserts were directionally cloned with Sal-Not arms using
                                                                                                                                                                                                                                                                                                                                                                             Newman, T., deBruijn, F.J., Green, P., Keegstra, K., Kende, H., McIntosh, L., Ohlrogge, J., Raikhel, N., Somerville, S., Thomashow, M., Retzel, E. and Somerville, C. Genes galore: a summary of methods for accessing results from large-scale partial sequencing of anonymous Arabidopsis cDNA clones 95148729

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Variance 154.962; scale 0.230 Mean 35,586; Statistics:

To identify a cDNA from tobacco which codes for citrate synthase, a cDNA bank of leaf tissue from tobacco was prepd. Plaques of this cDNA bank were screened using a radioactive DNA probe which comprises Solanum tuberosum citrate synthase cDNA (T04199). One of the clones was sequenced. The nt. sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Landschuetze

Inhibiting citrate synthase (CS) activity in plants - to inhibit of lower formation and improve storage capacity, e.g. in potatoes, also new CS sense and anti-sense DNA sequences.

Talso new CS sense and anti-sense DNA sequences.

Claim 5; Page 15-19; 35pp; German.

The potato citrate synthase (CS) gene or CDNA sequence encoding CS The potato citrate synthase (CS) gene or CDNA sequences. CS DNA sequences are useful for altering CS activity in plants. Antisense CS sequences are be used to inhibit CS activity in plants. Antisense CS sequences can be used to inhibit CS expression in plants and has the effect of inhibiting flower formation and by doing so improves the plant's storage capacity. This is partic. useful in crop plants of any kind but esp. useful in potatoes. In addition to altering CS activity the DNA sequences can also be used to identify similar sequences in the genomes of other plants and in the production of transgenic plants with altered CS activity. This sequence is represented the amino acid sequence of potato citrate synthase.

To identify a cDNA from potto which codes for citrate synthase, a CDNA fragment of citrate synthase from Arabidopsis thaliana was firstly amplified using A. thaliana cDNA and oligos T04202 and T04203 which are complementary to the 5' or 3' end of the coding region of A. thaliana cDNA for citrate synthase. The oligos additionally introduce BamHI cleavage sites at both ends of the amplified cDNA fragment. a cDNA library was prepd. from potato leaves and screened with A. thaliana citrate synthase cDNA. Positive clones were purified and sequenced. The nt sequence is given in T04199.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 'n

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The aarA gene encodes the citrate synthase and is part of an acetic acid resistance operon comprising aarA, aarB and aarC. The DNA can be used to prepare an acetic acid resistant strain of bacteria for use in acetic acid fermentation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Acetic acid resistant gene with in plasmid and transformed acetobacter - improves yield of acetic acid fermentation. WCUH 29 - useful for protection against bacterial infections claim it Pages 19-20; Jupp: English.

The present sequence is a novel methionyl tRNA synthetase protein from Staphylococcus aureus strain WCUH29 (NCIMB 40771), which is related by amino acid sequence homology to Bacillus subtilis tRNA synthetase encoded by the mets gene. The enzyme catalyses the aminoacylation of tRNA-Met, by a two step mechanism. The first step involves formation of a stable enzyme:methionyl adenylate complex resulting from the specific binding and reaction of ATP and L-methionine. Subsequently, the 3' terminal adenosine of anzyme-bound tRNA-Met reacts with the aminoacyl adenylate, leading to to the esterification of the tRNA and release of AMP. Vectors comprising the DNA (or polynucleotides having at least 70 % identity to it) can be used for the recombinant production of the anzyme or tryme. The enzyme or its related DNA (through gene therapy) is used to induce an immunological response in a manmal to generate antibodies to protect against disease. The antibodies protect against disease. The antibodies protect against disease. The antibodies or by mechanical, chemical or thermal damage or by mechanical, chemical or thermal damage or by morphysics or wounds in the mucous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Methyl tetrahydropteroyltriglutamate-homocysteine methyltransferase. Streptococcus pneumoniae protein; genetic immunisation; antagonist; immunological response; inoculation; antibody production; inhibitor; T cell immune response; antimicrobial compound; bacterial adhesion; extracellular matrix protein; protein-mediated cell invasion; wound; pathogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel Streptococcus pneumoniae proteins and related DNA - useful for diagnosing anti-microbial agents for treatment of bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
Methionyl-tRNA synthetase from Staph. aureus. tRNA synthetase; Bacillus subtilis; metS; immunological response; antibody; bacterial infection; adherence; damaged tissue; wound healing; skin; protection; vaccine. Staphylococcus aureus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               10; Mismatches 10; Indels 1;

This sequence represents a Streptococcus pneumoniae protein that, based on homology with an E. coll protein, is a methyl tetrahydropteroyltri glutamate-homocysteine methyltransferase, and is encoded by a DNA of the invention. The DNA sequences were isolated from S. pneumoniae strain closops (NCIMB 40794). The Streptococcus pneumoniae proteins of the invention can be used to identify compounds which interact with and inhibit or activate the activity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic immunisation. They can also be used to induce an immunological response in a mammal by inoculation with the S. pneumoniae proteins or delivery of the encoding nucleic acids in a vector adequate to produce antibody and/or recal immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bioactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian extracellular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal implantation of pathogenesis in infections initiated other than by the implantation of in-dwelling devices or other surgical techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3;

Plant defence responses to pathogens.

R89749 is a partial Arabidopsis proteasome, a plant defence-related protein PDRPS were isolated using a protein tresidues 33-194 fusion protein, i.e. AFTI (Arabidopsis 14-3-31) protein residues 33-194 fused to Lexa, a DNA binding protein, in an interaction trap assay. AFTI is a transcriptional activator protein and may be used to enhance, control or modify plant gene expression, e.g. in the regulation of plant storage components (esp. napin, legumin or phaseolin). AFTI can also be used to modulate signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      05-5EP-1996 (first entry)

08-JUL-1997 (first entry)

1. pylori cell envelope transporter protein, 179677.aa.

Cytoplasmic; vaccine; prevention; treatment; infection; identification;

Cytoplasmic; vaccine; prevention; iffe cycle; activator; bacteria, inhibitor;

duodenal ulcer disease; chronic gastritis; diagnosis; envelope;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a Helicobacter pylori cell envelope transporter protein. The protein may be used in a vaccine to prevent or treat H. Pylori infection or to identify H. Pylori polypeptide binding compounds, useful as potential H. Pylori life cycle activators or inhibitors. The genomic sequence of H. Pylori life cycle activators or determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. Pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   184 VVAAYVYRRMYKNGQVIPLD-DSLDYGGNFAHMLGFDSPQMLELMRLY--VTIHSDHEGG 240

                                                                                                                                                                                                                                                       T00532 encodes R84104 the equine herpesvirus 4 (EHV) unique short 2 (US2) gene prod. A recombinant attenuated EHV can be produced by deleting the above US2 gene (a region not essential for replication) from the viral DNA. The attenuated virus can be used as a foetal safe vaccine to protect an equine against EHV, or in a test to determine if an equine has been vaccinated against or is infected with EHV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 156 nkswqpsfv-cgklfetiplttv-dykhllkq-kvlpgqdhpesarsllqhkssfvsppp 212

The inserted sequence is a piece of foreign, double stranded DNA which encodes an RNA molecule which does not naturally occur in the animal into which the EHV is introduced. The foreign DNA sequence is introduced into the EHV is a homology vector. The cocombinant EHV's are used to prepare vaccines to protect horses from infectious EHV. Recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  6; Gaps

BR Hollochacter pylori nucleic acid sequences and encoded probacter pylori nucleic acid sequences to treat or prevent H. pylori protein and tor diagnosis of H. pylori infection and for diagnosis of H. pylori infection

BY Claim 14; Pages 556-557; 1145pp; Engilsh.

CC This sequence is a H. pylori protein of unspecified function.

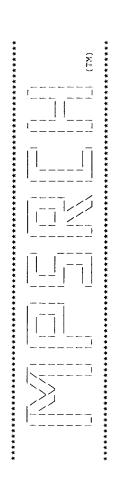

CC This sequences or inhibitors. The compounds of the pylori in a sample and the diagnosis of H. pylori infection or to identify H. pylori polypeptide binding compounds.

CC useful as potential H. pylori life cycle activators or inhibitors. The cut sequences complementary to the DNA and somblibitors. The cut sequences or complementary to the DNA and somblibitors and acid sequences or immibitors. The cut sequences or complementary to the DNA and somblibitors and distribution of H. pylori infection of H. pylori infection. Nucleic addistribution of H. pylori-specific antigens. The genomic sequences and distribution of H. pylori-specific antigens. The genomic sequences or addistribution of H. pylori-specific antigens. The genomic sequences or addistribution of H. pylori-specific antigens. The genomic sequences or core. For ore or or ore the actions to the bacterial DNA. The sequences or and version of H. pylori-specific antigens for or or ore feet least 180 nucleotides, and the predicted fooling regions conting education for significant and active from versions can be isolated from H. pylori by PCR companies, particular regions can be isolated from H. pylori by PCR consisting the particular sequences of interest, particular regions can be isolated from H. pylori by PCR consist Abach and active Now 1664e+01; Matches 10; Conservative 16; Mismatches 8; Indels 2; Gaps 2; Babst Local Similarity 27.8%; Pacer 951.
